KYRON eKYC

Identity verification you can trust

From signup to trusted return — secure digital KYC in one flow.

01

Pain point

Speed, trust, and proof pull against each other.

02

Solution

One secure flow: document, liveness, face match.

03

Results

Validated accuracy across document & liveness.

KYRON

The core problem

Identity verification forces a hard trade-off

Businesses want fast onboarding, but every shortcut can increase fraud, compliance risk, or manual review cost.

Pain point

Manual KYC is slow. Basic digital KYC is easy to attack.

Speed

Long KYC flow creates drop-off before signup is complete.

Trust

Fake IDs, edited documents, and replay attacks are hard to catch.

Proof

Teams need clear evidence for review, audit, and compliance.

KYRON

Where the pain shows up

Keep the story simple: the problem affects users, operations, and risk teams at the same

User pain

- Too many steps before account approval
- Camera and document capture feel confusing
- Repeated rejection without clear reason

Business pain

- Manual review slows growth
- Support teams handle avoidable failures
- Incomplete onboarding reduces conversion

Risk pain

- Fake documents and spoofed selfies
- Weak audit trail for verification decisions
- Hard to prove compliance readiness

The result: teams either slow down good users or let more risk through.

KYRON

The solution

Kyron verifies real users through one secure digital flow

Document proofing, liveness, face matching, fraud checks, and Face ID reuse work together to create a trusted onboarding journey.

One journey

from signup to trusted return

Document

Passport or Lao ID proofing

Liveness

Face actions and gesture challenge

Face match

Selfie matched to document portrait

Decision

Explainable pass, reject, and reason codes

Face ID

Reuse for login or payment approval

KYRON

How the solution works

Kyron combines verification steps that answer three questions: is the document real, is the person live, and does the face match?

Document proofing

Checks OCR/MRZ fields, expiry, quality, tamper signs, and fraud risk.

Liveness defense

Uses face movement, hand gestures, and passive anti-spoof checks.

Face matching

Compares the live selfie with the document portrait to confirm ownership.

Decision + reuse

Returns explainable results, then enables Face ID for future login or payment.

Result: faster onboarding, stronger fraud protection, and a reusable trusted identity.

KYRON eKYC

Results & validation

Measured on a balanced validation set of ~10,000 labelled images per category (genuine vs. attack).

Document upload

OCR + TD3 MRZ validation, quality & tamper checks

95.7%

Document verification accuracy

10,000 labelled passport & ID images — genuine documents read, forgeries & print / screen copies rejected.

Face liveness (anti-spoof)

PAD model + face-size gate + replay heuristics

96.4%

Liveness detection accuracy

10,000 bursts — real faces accepted; printed-photo, screen-replay & video attacks rejected.

Methodology: accuracy reported as detection / pass rate. Dataset expansion and threshold tuning are ongoing — figures reflect the current operating point and will tighten as the corpus grows.
